A perfect match from front to end

Meticulous design – all out of one hand

At Canon, we develop, design and manufacture the core imaging components of our industry-leading ultrasound equipment in-house to ensure that soft- and hardware work perfectly in sync to provide superior clinical and economic value to our customers and their patients.

Single crystal

Aplio connects to a range of transducers that use single crystal technology to provide better visualization and improved penetration of up to 50 cm, so you can better manage your hard-to-image patients.

iDMS matrix technology

Aplio's iDMS matrix array technology sharpens ultrasonic beams in the elevation direction to create a thin slice beam with continuous focus from the near to the far field.

Ultra-wideband transducers

Aplio's ultra-wideband, multi-frequency transducers provide superior sensitivity and resolution for both near and far field. The ability to use one transducer across different patient types can potentially reduce cost while providing enhanced imaging.

A higher definition of imaging

iBeam+ is the next level of ultra-fast and precise beam shaping, enhancing image depth and detail with clear, sharp, and distinct images.

Aplio's iBeam+ beamformer technology enables up to 4 times faster* image processing in real time to provide sharper images with better penetration and thus optimal, more robust results for higher clinical confidence.

In combination with other imaging modes or advanced applications, iBeam+ can help you to improve clinical utility and operability with enhanced image uniformity, higher speed and fewer operation steps* to achieve an optimal result.

*compared to the previous versions of Aplio i-series

Improved uniformity

Aplio's innovative Full Focus function enables clear, uniform images from near and to far field without the need for focus adjustments. With fewer adjustment steps and greater uniformity, this can be particularly useful for screening examinations.

Enhanced penetration

The improved bandwidth and processing power of the iBeam+ beamformer results in images with better penetration and detail resolution, so you can see more without having to switch to a lower frequency transducer.

Ultra Wide View

While typically the footprint of a transducer has limited the anatomy that we can show, Canon's Ultra Wide View allows you to extend the field of view by up to 100% while maintaining excellent image quality and frame rate throughout.
